

RAFT SNAPSHOTS OPENBAO

A CronJob with its own identity, verified archives to S3,
and a restore you have actually rehearsed.

A CronJob that logs in with its ServiceAccount, verifies the snapshot and writes it to S3 – and a restore drill on a throwaway cluster

This guide is in progress. Planned: What a Raft snapshot is, and why there is no inspect; Policy and Kubernetes auth role for the snapshot job; The CronJob: save, verify, upload to S3 (MinIO); Retention and staleness check; Restore drill on a kind cluster: -force and two key sets; What went wrong; Operation: keys apart from snapshots, alerting.

Prerequisites: S3-compatible target in the cluster (MinIO) or external.

-- draft
Published once everything has been run on the cluster.
